

```
terraform {
  required_providers {
    azurerm = {
      source = "hashicorp/azurerm"
      version = "5.1.0"
    }
  }
}

provider "azurerm" {
  features {}
}

resource "azurerm_resource_group" "rg" {
  name     = "rg-storage-humana"
  location = "West Europe"
}

resource "azurerm_resource_group" "rg1" {
  name     = "rg-storage-humana1"
  location = "West Europe"
}
```

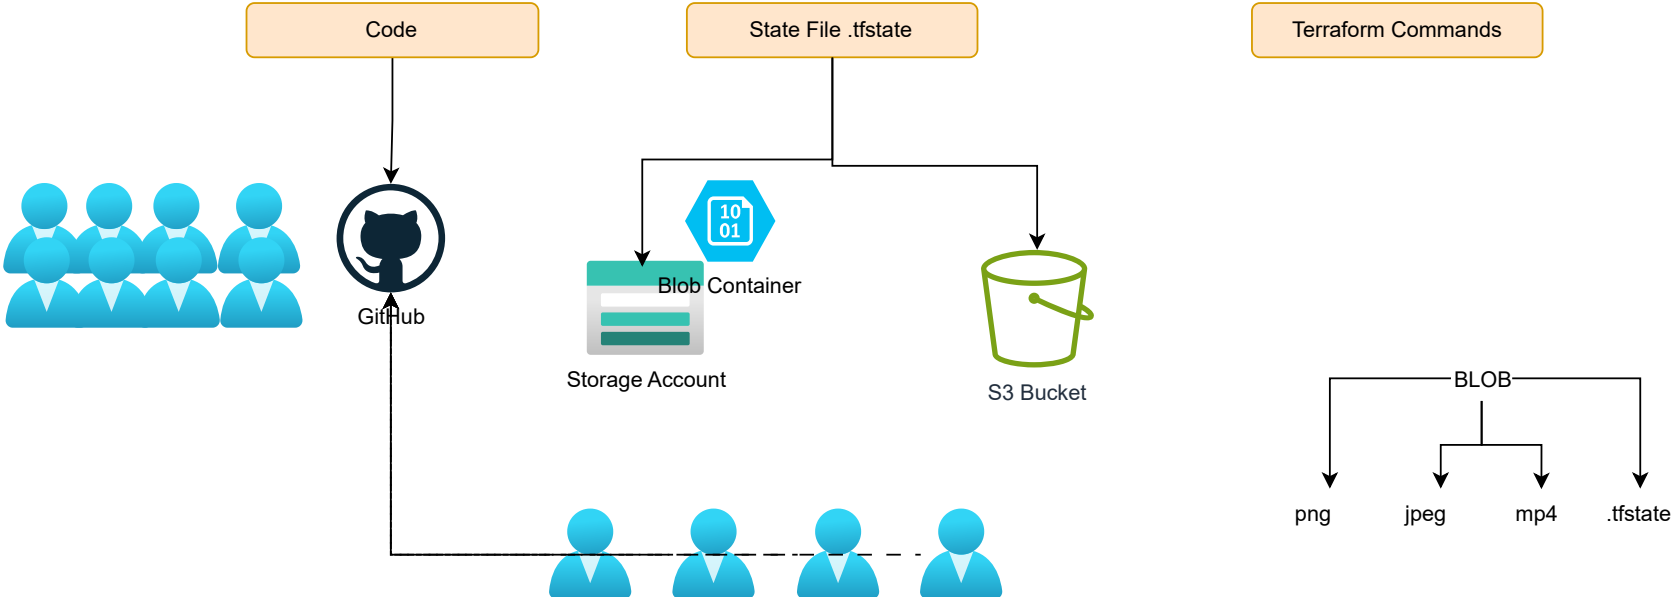

- Agar koi developer chutti pr chla gya and code uske local pr rakha hua hai, hum agar code ko access krna chahenge,
- Is code ko remote location pr rakho...
- IT jagat me jitne bhi software bane hai sare ko rakha jata hai source code management tool pr iske lie hamare paas github naam ke ek trending tool hai..
- Code ko remote me github me rakhenge, Storage location hai..
- Github ke piche ka technology is Git
- More tools are there like BitBucket, Gitlab, Azure Repo, AWS Code Commit etc..

- Local me rehne ke problems
1. Laptop Dependency
2. Team Collaboration
3. Risk of State file Loss
- Ye problems se bachne ke lie State file ko local se utha ke remote storage account me le jaenge..
1. Create a RG state file manually
2. Create a new storage account to store state manually
3. Create one blob container inside the storage account.
4. Local se state file ko remote pr lane ke process ko backend bolte hai...backend is a type of block, This is a type 2 block. ye block terraform block ke andar me jata hai...-

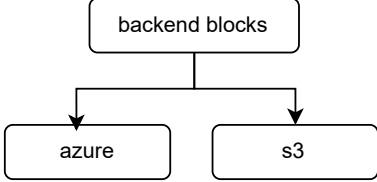

```
terraform {
  required_providers {
    azurerm = {
      source = "hashicorp/azurerm"
      version = "5.1.0"
    }
  }
}

backend "azurerm" {
  resource_group_name = ""
  storage_account_name = ""
  container_name = ""
  key = ""
}
```

Interview Question: Why state File should not be stored in git?

- Local se state file uthake Remote Storage account me pahuchane ke lie jo process hota hai usko backend configuration bolte hai..
- Aur backend configuration ke lie jo block aata hai usko backend block bolte hai..

- Advantages of Remote State
1. Centralised Location
2. Multiple Team Members can work
3. State Locking Feature
4. Storage account is most secure place
5. Backup, Versioning, Redundancy etc..

State locking feature autoenabled in remote state.
